

Architecture, Neurocytology and Comparative Organization of Monkey and Human Cingulate Cortices

Brent A. Vogt

Chapter contents

Introduction 66

- Comparison not evolution 66
- Brodmann's comparative work 66
- Apple-to-apple comparisons 66

Goals of this Chapter 67

Comparative Methodological Issues 67

Comparative Cytoarchitecture: Immunohistochemistry of Neurons and Areas 69

- Area 25 69
- Area 24b 69
- Area p24c' 69
- Area d23b 69

Medial Surface Features 69

Flat Maps of Primate Medial Cortex 70

- Ectocallosal cortex 71
- Anterior cingulate cortex 71
- Midcingulate cortex 71
- Posterior cingulate and retrosplenial cortices 71

Comparative Neurocytology: Common Points in the Brains of Two Primates 71

Anterior Cingulate Cortex 72

- Area 24b 72
- Area 32 73

Midcingulate Cortex 73

- Area 24d: Largest Neurons 74

The callosal sulcus 77

The pMCC subregion 79

Retrosplenial Cortex and Differentiation Trends 79

Pyramidal Neurons in the Context of Cortical Transition 81

Posterior Cingulate Cortex 81

- Area d23: Layer IV 81
- Area 23c: Layer IV in caudal cingulate sulcus and transition to area 5Ci 83
- Dorsal and ventral PCC 83
- Area 31 and Its Interface with Medial Parietal/Precuneal Area 7m 84

Where is Monkey Cingulate Cortex "in" the Human? 85

- Flat map comparisons 87
- Anterior section comparisons 87
- Posterior section comparisons 88

Where is the rat cingulate cortex "in" the monkey? 88

Perspectives on Primate Comparative Neuroanatomy 89

Comparative Overview of the Midcingulate Region 90

- Cytological perspectives on the cingulate premotor areas 90
- Animal models of human neuron diseases 90
